Attorney Docket No. 1001.102 Customer No.: 95674

Amendments

This listing of claims will replace all prior versions, and listing. Of claims in the application:

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

- 1-5 (Cancelled).
- 6. (Currently Amended) A heat resistant flexible laminate obtained by the method for manufacturing a heat resistant flexible laminate comprising a step of laminating a heat resistant adhesive material and a metal foil by thermal lamination in a temperature range of not less than 200 degrees C, wherein a film-like protective material is disposed on the outside of the metallic foil between a pressurized surface and the metallic foil at the time of thermal lamination, and

a metallic foil having a coefficients of linear expansion defined as \bullet_{o} ppm/degree C of the heat resistant adhesive material and the protective material in a temperature range of 200 degrees C to 300 degrees C and a heat resistant adhesive material are within a range of \bullet_{o} ± 10 ppm/degree C, when having a coefficient of linear expansion within a range of \bullet_{o} ± 10

by thermal lamination in a temperature range of not less than 200 degrees C,

wherein a film-like protective material having a coefficient of linear expansion

within a range of • ± 10 is disposed on the outside of the metallic foil between a

pressurized surface and the metallic foil at the time of the thermal lamination, and

Appl. No. 10/532,766 Amdt. Dated November 9, 2010 Reply to Final Office Action of July 7, 2010

Attorney Docket No. 1001.102 Customer No.: 95674

of the metallic foil is defined as • wherein the metallic foil is a rolled copper foil or an electrolytic copper foil.

- 7. (Cancelled)
- 8. (Currently Amended) The <u>method for manufacturing a heat resistant flexible</u> laminate according to Claim 6,

wherein the film-like protective material is a heat resistant plastic film.

9. (Currently Amended) A heat resistant flexible laminate obtained by the The method for manufacturing a heat resistant flexible laminate comprising a step of laminating

a heat resistant adhesive material and a metallic foil having a coefficient of linear expansion defines as $\bullet_{\circ} \pm 10$ ppm/degree C in a temperature range of 200 degrees C to 300 degrees C and a heat resistant adhesive material having a coefficient of linear expansion within a range of $\bullet_{\circ} \pm 10$

by thermal lamination in a temperature range of not less than 200 degrees C, wherein a reusable film-like protective material having a coefficient of linear expansion within a range of • ± 10 is detachably secured to the outside of the metallic foil between a pressurized surface and the metallic foil at the time of thermal lamination, such that the protective material can be removed after lamination and re-used, and

the protective material in a temperature range of 200 degrees C to 300 degrees C are within a range of • ± 10 ppm/degree C, when a coefficient of linear expansion of the metallic foil is defined as • , wherein the metallic foil is a rolled copper foil or an electrolytic copper foil.
